Designed for a sheltered Location
The Cloche Heights are from Ground Level

Cover Options

Micro Mesh:

Combination Cover for:

Hot House Effect – Frost/Wind protection
Insect cover – Bird & Pest protection

Micro Mesh is a versatile crop cover knitted from thin but strong UV stabilized polyethylene transparent thread, unlike plastic it allows water to permeate through the mesh self ventilating in the process creating a healthy growing environment.

Micro Mesh will keep out pests down to carrot fly. Micro Mesh promotes early growth and yield of young plants on to maturity giving a 6 to 8 week harvest advantage with ease of management if you have a busy life style.

Cloche plastic

Hot House Effect-High Humidity for Germination-Wind/Frost Protection

Cloche plastic is a standard non w stabilized cover supplied with all standard garden series Cloche systems .Unlike Micro Mesh its life is only up to two seasons.

The soil temperature and humidity can be raised quicker than Micro mesh so germination can take place from seed. Plastic covers can also be used in autumn to extend the growing season.

The spring clip on the cloche should be used to vent on the hot days to avoid over heating as per the instructions.

Plastic Cloche film can also be used in Combination with Micro mesh under the same spring clip.

Cloche Systems
